

WHAT IS A DKDM ?

A **D**(istribution)**KDM** is a KDM. There is no difference between the two.

DKDM is a term used when a KDM is intended for another postproduction entity instead of theaters. For example, when a laboratory wants to deliver encryption keys to another laboratory that creates, rewraps or unwraps DCPs and their encrypted content.

The **Recipient** (in **AuthenticatedPublic** > **RequiredExtensions**) will be set to another encoder (such as DMS2000) instead of a DCI player in a theater.

To learn everything about DKDM, simply read the [KDM](#) chapter :)
